

3

Data Representation Methods in the Computer system

In this unit you will learn,

- computer data representation,
- Decimal, Binary, Octal and Hexadecimal number systems,
- most and least significant positional value of a number,
- converting decimal numbers to binary, octal numbers to hexadecimal numbers
- conversion among binary, octal, hexadecimal and decimal numbers,
- data storage capacity,
- coding systems in computers.

3.1 Computer Data Representation

3.1.1 Number System

A computer cannot understand human language directly. Accordingly, the data and instructions given by users are recognized by the computer in a symbolic form.

The computer uses a unique language to represent data and instructions. This language consists only of the symbols 0 and 1. These 0 and 1 are represented within the computer by two different voltage levels. The representation of data using only these two symbols, 0 and 1, is known as binary representation.

At present, the above-mentioned binary representation has evolved into multi-state representation with the advancement of technology. In multi-state representation, more than two states are used, and this is known as Quantum Computing.

In this new technological approach, devices such as flash memory have the ability to store multiple values in a single memory cell at the same time. When multiple values are stored within one memory cell, that memory unit is referred to as a qubit (Quantum bit).

Each number system is made of a Number, Base / Radix and Place value.

Number

A number is a symbol which represents a unit or quantity.

Base / Radix

A number of symbols used in a number system is called the base/radix. The base of any number system is indicated in decimal numbers. Each number system is determined by the number of symbols it contains, which is known as its base.

Place Value

Place value means the value assigned to a digit based on its position in a number.

Table 3.1 - Number systems used in the computer

Number System	Base Value	Number and Alphabetic character used
1. Binary	2	0, 1
2. Octal	8	0, 1, 2, 3, 4, 5, 6, 7
3. Decimal	10	0, 1, 2, 3, 4, 5, 6, 7, 8, 9
4. Hexa - decimal	16	0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

3.2 Decimal, Binary, Octal and Hexa-Decimal Number Systems

3.2.1 Decimal Number System

From our childhood, we have learnt to perform calculations using decimal Number System which consists of digits from 0 to 9.

Normally, the base value of decimal numbers are not mentioned, but for the other numbers the base value has to be mentioned. The digits that are used in the

decimal number system are as follows;

Table 3.2 – Digits of Decimal Number System

Number System	Decimal Number System or base 10 number system
Base / Radix	10
Digits used	0, 1, 2, 3, 4, 5, 6, 7, 8, 9

Let us study how a number included in the decimal number system is formed. Before that,

considering all the conversions you have studied above, let us look at two examples of their practical applications.

Example

Let us consider how the number 25 is formed.

25 is formed with the addition of 20 and 5.

$$\begin{aligned}
 25 &= 20 + 5 \\
 &= (2 \times 10) + (5 \times 1) \\
 &= (2 \times 10^1) + (5 \times 10^0)
 \end{aligned}$$

These positional values such as 10^0 , 10^1 , 10^2 are called Weighting Factors of decimal number system. This number can be shown on a counting frame (abacus). (Figure 3.1)

Figure 3.1 – Decimal number representation of 25

This can be shown as given below, as well.

$$\begin{array}{r} 2 \quad 5 \\ \downarrow \quad \downarrow \\ 5 \times 10^0 = 5 \\ 2 \times 10^1 = \underline{\underline{20}} \\ \hline 25 \end{array}$$

Example

Next, let us consider how a decimal number is formed.

$$\begin{array}{cccccc} 3 & 0 & 2. & 7 & 5 & \text{- decimal number} \\ \downarrow & \downarrow & \downarrow & \downarrow & \downarrow & \\ 10^2 & 10^1 & 10^0 & 10^{-1} & 10^{-2} & \text{- weighting factor} \\ & & = (3 \times 10^2) + (0 \times 10^1) + (2 \times 10^0) + (7 \times 10^{-1}) + (5 \times 10^{-2}) \\ & & = 300 + 0 + 2 + \frac{7}{10} + \frac{5}{100} \\ & & = 300 + 0 + 2 + 0.7 + 0.05 \\ & & = 302.75 \end{array}$$

$$\begin{array}{r} 302.75 \\ \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \quad \downarrow \\ 5 \times 10^{-2} = 0.05 \\ 7 \times 10^{-1} = 0.7 \\ 2 \times 10^0 = 2 \\ 0 \times 10^1 = 0 \\ 3 \times 10^2 = \underline{\underline{300}} \\ \hline 302.75 \end{array}$$

3.2.2 Binary Number System

Though we use the decimal number system when we input numbers as data or instructions, the computer represents these data as 0 and 1. The number system which consists of 0 and 1 is the binary number system.

Figure 3.2 – Electronic circuit

The digits for the binary number system is given below. (Table 3.3)

Table 3.3 – Digits used in the Binary Number System

Number System	Binary Number System
Base	2
Digits used	0,1

For instance, let us consider 11101101_2 .

1	1	1	0	1	1	0	1_2	- decimal number
↓	↓	↓	↓	↓	↓	↓	↓	
2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0	- weighting factor

The values such as $2^0, 2^1, 2^2, 2^3 \dots$ are called the weighting factors of binary number system.

2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0
1	1	1	0	1	1	0	1

This number can be indicated in a binary base counting frame as given below. (Figure 3. 3)

Figure 3.3 – Binary number representation.

The Binary number system is very important in computing and it contributes in the representation of a bit; the basic measuring unit of the computer. The smallest value and the highest value which can be seen in this number system is 0 or 1 respectively. This smallest value is called Binary Digit

3.2.3 Octal Number System

The number system which uses eight digits: 0, 1, 2, 3, 4, 5, 6, 7 is called the octal number system.

Digits of the octal number system are given below. (Table 3.4)

Table 3.4 – Digits of Octal Number System

Number System	Octal Number System
Base	8
Digits used	0, 1, 2, 3, 4, 5, 6, 7

For instance, let us consider 236_8 .

2	3	6	- octal number
↓	↓	↓	
8^2	8^1	8^0	- weighting factor

The values such as $8^0, 8^1, 8^2, 8^3 \dots$ are called the weighting factors of the octal number system. This number can be represented as given below in a base eight counting frame. (Figure 3.4)

Figure 3.4 – Octal number representation

3.2.4 Hexa-Decimal Number System

The computer uses binary numbers and it is difficult for human beings to read them. Hence, the hexadecimal number system is used as it is easier for humans to use. Normally, calculations are performed using the ten fingers of the hands. Just imagine you have sixteen fingers on your hands. Then you can use sixteen numbers to count. In the hexadecimal number system, ten digits are used from 0 to 9 and for

the other 6 digits, A, B, C, D, E and F symbols are used. Here, A, B, C, D, E and F are used to represent 10, 11, 12, 13, 14 and 15. (Table 3.5)

Table 3.5 – Comparison of Decimal and Hex-Decimal numbers

Decimal Number	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Hexa-Decimal Digit	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F

The Digits of the hexadecimal number system are given in the table below. (Table 3.6)

Table 3.6 - Digits of Hexadecimal Number System

Number System	Hexadecimal Number System
Base	16
Digits Used	0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

When F the largest number of hexadecimal number system, is expressed in binary form, it can be indicated with 4 Bits. Thus, instead of using a binary number with 4 Bits, a single number in hexadecimal number system can be used. For example, Hexadecimal numbers are used to represent memory addresses of the computer.

Here, 16^0 , 16^1 , 16^2 , 16^3 values are called Hexadecimal Weighting Factors. This number can be represented on a sixteen base counting frame as below. (Figure 3.5)

Figure 3.5 – Sixteen base number representation

Relationship among Decimal, Binary, Octal and Hexadecimal

Table 3.7 - Relationship among Decimal, Binary, Octal and Hexadecimal

	Decimal	Binary	Octal	Hexadecimal	
2^0	0	0	0	0	$8^0, 16^0$
	1	1	1	1	
2^1	2	10	2	2	
	3	11	3	3	
	4	100	4	4	
	5	101	5	5	
	6	110	6	6	
	7	111	7	7	
2^3	8	1000	10	8	8^1
	9	1001	11	9	
	10	1010	12	A	
	11	1011	13	B	
	12	1100	14	C	
	13	1101	15	D	
	14	1110	16	E	
	15	1111	17	F	
2^4	16	10000	20	10	16^1
	17	10001	21	11	
	18	10010	22	12	
	19	10011	23	13	
	20	10100	24	14	
	21	10101	25	15	
	22	10110	26	16	
	23	10111	27	17	
	24	11000	30	18	

Let us consider the instance where number systems are used for computer colors. Any color can be made with the combination of different degrees of red, green and blue.

These can be represented as RGB (Red, Green, Blue) and the value of any color is limited from 0 to 255. Therefore, the value of a primary color can also be represented using two symbols.

For instance, if you need to use dark purple for the background of a document, that color can be represented in the computer as “135, 31, 120” (Figure 3.6). With these numbers, the color combination for the above color is represented in decimal numbers. Binary numbers for 135, 31 and 120 are 1000001112, 111112, and 11110002.

Figure 3.6 – Colour representation in computer

You can see code “# 871F78” related to the dark purple color shown in Figure 3.6. This shows that, in order to create the purple color, the values of the primary colors Red, Green, and Blue should be 87,1F,78 respectively. Here the value of the color is started with “#” symbol. The color value is indicated in the computer in hexa decimal numbers. Thus, the code for dark purple in the above example is “# 871F78”. R,G,B values of this can be indicated from 0 to 255 in decimal numbers. If “#” or “&H” (ampersand) symbol is used in front of the value of any value, it is a hexa decimal number. Given below in Table 3.7 are the hexa decimal values and RGB values of dark purple color.

Table 3.8 – Hexadecimal Value of Dark Purple Colour

Name of Colour	Colour	Hexadecimal Value	R	G	B
Dark Purple		# 871F78 &H 871F78	135	31	120

For instance, let us consider $15E_{16}$

$\begin{matrix} 1 & 5 & E_{16} \text{ - Hexa-decimal number} \\ \downarrow & \downarrow & \downarrow \\ 16^2 & 16^1 & 16^0 \text{ - Weighting factor} \end{matrix}$

$\begin{matrix} 16^2 & 16^1 & 16^0 \\ \swarrow & \downarrow & \searrow \\ & 15E_{16} & \end{matrix}$

Activity

1. Consider number “ 23_y ”. Here, ‘y’ is the base of the number system.

From the number systems you have learned, as to which number system “ 23_y ” belongs.

2. Convert the decimal number 83_{10} to a binary number. Show steps.

3. Convert the binary number 10110111_2 to an octal number. Show steps.

4. Convert the hexadecimal number $23D_{16}$ to a binary number.

5. Convert the octal number 638 to a hexadecimal number.

6. What is the minimum number of bits required to present the hexadecimal number A5E16?

7. Convert the binary number 1101110100112 to a hexadecimal number. Show steps.

8. Fill in the blanks in the table given below.

Name of the Colour	Colour	Hexadecimal Value	R	G	B
Dark purple		# 871F78	135	31	120
Light pink			255	182	193
Sky blue			50	153	204
Green			0	255	0
Yellow			255	238	0

3.3 Most and Least Significant Positional Value of a Number

There are two separate methods to find the most and least significant values of decimal numbers and whole numbers. When a whole number is read from left to right, the number in the right most end is the least significant positional value and the number in the left most end which is not 0 is the most significant positional value.

If the given value is zero ('0'), both the MSD and LSD are considered to be zero.

In decimal numbers, the value in the right extreme after the decimal point which is not 0 becomes the least significant positional value and the number in the left extreme of the decimal point which is not 0 becomes the most significant positional value.

3.3.1 Most Significant Digit (MSD) and Least Significant Digit (LSD)

Given below in Table 3.9 are the most and least significant digits of a round figure or a decimal number.

Table 3.9 – The Most and Least Significant Positional Value of a number

Number	MSD	LSD
3290	3	0
425	4	5
1237.0	1	7
58.32	5	2
0.0975	9	5
0.4	4	4

You can use the same method used for the decimal number system to find the most and least significant positional digits of binary, octal and hexadecimal numbers.

Activity

Find the most significant digit and the least significant digit of the following numbers.

- (i) 56870_{10} (ii) 154.01_{10} (iii) 23.080_{16} (iv) $AD\ 239_{16}$
 (v) 0.00110_8 (vi) 720.05 (vii) 440 (viii) 120_8

3.3.2 Most Significant Bit (MSB) and Least Significant Bit (LSB)

Only the Binary Number System is used to find the most significant bit (MSB) and the least significant bit (LSB). There are two ways to find this using decimal numbers and whole numbers.

In a whole number, read from left to right, the value in the right extreme is the least significant bit and the value in the left extreme which is not 0 is the most significant bit. In binary decimal numbers, the value in the right extreme of the decimal point which is not 0 is the least significant bit and the value in the left extreme of the decimal point which is not 0 is the most significant bit.

Table 3.10 - The most significant bit and the least significant bit

Binary Number	MSB	LSB
<u>1</u> 00 <u>1</u>	$1 = (2^3)$	$1 = (2^0)$
0 <u>1</u> 1. <u>1</u> 0 <u>1</u>	$1 = (2^1)$	$1 = (2^{-3})$
<u>1</u> 01 <u>0</u>	$1 = (2^3)$	$0 = (2^0)$
<u>1</u> 01. <u>1</u> 00	$1 = (2^2)$	$1 = (2^{-1})$

Activity

Find the most significant bit and the least significant bit of the following numbers.

- (i) 1000_2 (ii) 011101_2 (iii) 0.11001_2 (iv) 1.0010_2
 (v) 0.00110_2 (vi) 1011_2 (vii) 0.1_2 (viii) 0.10_2

3.4 Converting Decimal Numbers to Binary, Octal and Hexa-Decimal Numbers

3.4.1 Conversion of Decimal numbers to numbers of other bases

All the data we input to the computer is taken by it as digits of binary number system; 0 and 1. Hence, the knowledge to convert a base ten number to another base is important. Here in this chapter, conversion of a decimal number to a binary number, octal number and a hexadecimal number is discussed.

3.4.2 Conversion of Decimal Numbers to Binary Numbers

When a decimal number is converted to a binary number, the decimal number can be divided by two until the remainder is 0 and the remainder of the division can be written on the right side. After that, write all the remainders from the bottom to top to build the number.

Example

Converting number 12_{10} to a binary number.

- First, divide this number by 2 writing the remainders.

- Secondly, write down all the remainders from bottom to top.

$$12_{10} = \underline{\underline{1100_2}}$$

Example

Converting 46_{10} to a binary number.

2		46						
	2		23	— 0				
		2		11	— 1			
			2		5	— 1		
				2		2	— 1	
					2		1	— 0
						0	— 1	

$46_{10} = 101110_2$

Activity

Convert the following decimal numbers to binary numbers.

- (i) 37_{10} (ii) 85_{10} (iii) 125_{10} (iv) 257_{10} (v) 365_{10}

3.4.3 Converting Decimal Numbers to Octal Numbers

Here, divide the given number by 8 until the remainder is 0 and write the remainders from bottom to top.

Example

Converting 158_{10} to an octal number.

- Firstly, divide this number by 8 and write down the remainder.

8		158			
	8		19	— 6	
		8		2	— 3
			0	— 2	

↑ Remainders

↖ Quotient

- Secondly, write down all the remainders from bottom to top.

$$\underline{\underline{158_{10} = 236_8}}$$

Activity

Convert the following decimal numbers to octal numbers.

(i) 37_{10}

(ii) 85_{10}

(iii) 125_{10}

3.4.4 Converting Decimal Numbers to Hexadecimal Numbers

Here, divide the number by 16 until the remainder is 0 and write down the remainders from bottom to top.

Example

Converting number 38_{10} to a hexadecimal number.

- Firstly, divide this number by 16 and write down the remainders.

$$\begin{array}{r|l}
 16 & 38 \\
 \hline
 16 & 2 \quad \text{---} \quad 6 \\
 & 0 \quad \text{---} \quad 2
 \end{array}
 \begin{array}{c}
 \uparrow \\
 \text{remainders}
 \end{array}$$

$\nearrow$
 Quotient

- Secondly, write down all the remainders from bottom to top.

$$\underline{\underline{38_{10} = 26_{16}}}$$

Example

Converting number 47_{10} to a hexadecimal number.

$$\begin{array}{r|l}
 16 & 47 \\
 \hline
 16 & 2 \quad \text{---} \quad 15 \rightarrow F \\
 & 0 \quad \text{---} \quad 2 \rightarrow 2
 \end{array}
 \begin{array}{c}
 \uparrow \\
 \text{remainders}
 \end{array}$$

$$\underline{\underline{47_{10} = 2F_{16}}}$$

Activity

Convert the following decimal numbers to hexadecimal numbers.

(i) 37_{10}

(ii) 85_{10}

(iii) 125_{10}

(iv) 200_{10}

(v) 350_{10}

3.5 Conversion among Binary, Octal, Hexadecimal and Decimal Numbers

We have converted decimal numbers (base ten) to binary, octal and hexadecimal numbers earlier. Now let us consider how to convert binary numbers to decimal numbers, octal numbers to decimal numbers and hexadecimal numbers to decimal numbers. (Figure 3.11)

Figure 3.7 – Conversion between number systems

3.5.1 Converting Binary Numbers to Decimal Numbers

Example

Converting number 1101_2 to a decimal number.

$$\begin{array}{cccc}
 1 & 1 & 0 & 1 \\
 \downarrow & \downarrow & \downarrow & \downarrow \\
 2^3 & 2^2 & 2^1 & 2^0 \\
 1101_2 & = (1 \times 2^3) + (1 \times 2^2) + (0 \times 2^1) + (0 \times 2^0) \\
 & = (1 \times 8) + (1 \times 4) + (0 \times 2) + (1 \times 1) \\
 & = 8 + 4 + 0 + 1 \\
 \underline{\underline{1101_2 = 13_{10}}}
 \end{array}$$

$$\begin{array}{lcl}
 1101_2 & & \\
 \begin{array}{l} \text{---} \rightarrow 1 \times 2^0 = 1 \\ \text{---} \rightarrow 0 \times 2^1 = 0 \\ \text{---} \rightarrow 1 \times 2^2 = 4 \\ \text{---} \rightarrow 1 \times 2^3 = 8 \end{array} & & \\
 \underline{\underline{1101_2 = 13_{10}}} & & \underline{\underline{13}}
 \end{array}$$

Activity

Convert the following binary numbers to decimal numbers.

- (i) 101_2 (ii) 11101_2 (iii) 101001_2 (iv) 111011_2

3.5.2 Converting Octal Numbers to Decimal Numbers

Example

Converting number 1275_8 to a decimal number.

$$\begin{array}{cccc} 1 & 2 & 7 & 5 \\ \downarrow & \downarrow & \downarrow & \downarrow \\ 8^3 & 8^2 & 8^1 & 8^0 \end{array}$$

$$\begin{aligned} 1275_8 &= (1 \times 8^3) + (2 \times 8^2) + (7 \times 8^1) + (5 \times 8^0) \\ &= (1 \times 512) + (2 \times 64) + (7 \times 8) + (5 \times 1) \\ &= 512 + 128 + 56 + 5 \end{aligned}$$

$$\underline{\underline{1275_8 = 701_{10}}}$$

$$\begin{array}{lcl} 1275_8 & & \\ \downarrow & \rightarrow & 5 \times 8^0 = 5 \\ \downarrow & \rightarrow & 7 \times 8^1 = 56 \\ \downarrow & \rightarrow & 2 \times 8^2 = 128 \\ \downarrow & \rightarrow & 1 \times 8^3 = 512 \\ & & \underline{\underline{701}} \end{array}$$

$$\underline{\underline{1275_8 = 701_{10}}}$$

Activity

Convert the following octal numbers to decimal numbers.

- (i) 67_8 (ii) 54_8 (iii) 112_8 (iv) 221_8 (v) 374_8

3.5.3 Converting Hexadecimal Numbers to Decimal Numbers

Example

Converting number 329_{16} to a decimal number.

$$\begin{array}{ccc}
 3 & 2 & 9 \\
 \downarrow & \downarrow & \downarrow \\
 16^2 & 16^1 & 16^0
 \end{array}$$

$$\begin{aligned}
 329_{16} &= (3 \times 16^2) + (2 \times 16^1) + (9 \times 16^0) \\
 &= (3 \times 256) + (2 \times 16) + (9 \times 1) \\
 &= 768 \quad + 32 \quad + 9 \\
 \underline{\underline{329_{16} = 809_{10}}}
 \end{aligned}$$

$$\begin{array}{l}
 329_{16} \\
 \begin{array}{l}
 \rightarrow 9 \times 16^0 = 9 \\
 \rightarrow 2 \times 16^1 = 32 \\
 \rightarrow 3 \times 16^2 = 768 \\
 \hline
 809
 \end{array} \\
 \underline{\underline{329_{16} = 809_{10}}}
 \end{array}$$

Example

Converting number $AB2_{16}$ to a decimal number.

$$\begin{array}{ccc}
 A & B & 2 \\
 \downarrow & \downarrow & \downarrow \\
 16^2 & 16^1 & 16^0
 \end{array}$$

$$\begin{aligned}
 AB2_{16} &= (A \times 16^2) + (B \times 16^1) + (2 \times 16^0) \\
 &= (10 \times 256) + (11 \times 16) + (2 \times 1) \\
 &= 2560 \quad + 176 \quad + 2 \\
 \underline{\underline{AB2_{16} = 2738_{10}}}
 \end{aligned}$$

$$\begin{array}{l}
 AB2_{16} \\
 \begin{array}{l}
 \rightarrow 2 \times 16^0 = 2 \\
 \rightarrow 11 \times 16^1 = 176 \\
 \rightarrow 10 \times 16^2 = 2560 \\
 \hline
 2738
 \end{array} \\
 \underline{\underline{AB2_{16} = 2738_{10}}}
 \end{array}$$

Activity

Convert the following hexadecimal numbers to decimal numbers

- (i) $1A_{16}$ (ii) $12B_{16}$ (iii) $2BC_{16}$ (iv) 823_{16} (v) $A49_{16}$

3.5.4 Converting Binary Numbers to Octal Numbers

From the digits used in the octal number system; 0, 1, 2, 3, 4, 5, 6, and 7, the largest digit is 7. We can indicate digit 7 as 111_2 in binary form. Thus 7; the largest digit in the octal number system, can be indicated in a binary form with 3 digits. Likewise, all the digits in the octal number system can be indicated in the three digit binary form. Given below in Table 3.11 are the binary forms of the digits used in eight base (octal) number system.

Table 3.11 – Indicating octal digits in decimal and binary numbers.

Decimal Number	Octal Number	Binary Number
0	0	000
1	1	001
2	2	010
3	3	011
4	4	100
5	5	101
6	6	110
7	7	111

As per the above table, three bits are used when indicating an octal number in binary form. ($8 = 2^3$)

Let us consider how a binary number is converted to an octal number.

Example

Converting 1011101_2 to an octal number.

- First, divide the number into three bits from the right corner to the left corner. If the last cluster in the left corner does not consist of 3 bits, add 0s to complete.
- Write each octal number separately for each cluster.
- Then write these clusters in octal digits.
- Write these digits in order from the left corner to the right corner.

$$\underline{\underline{1011101_2 = 135_8}}$$

Activity

Convert the following binary numbers to octal numbers.

- (i) 10011001_2 (ii) 111100111_2 (iii) 10101010110_2
 (iv) 1011101110_2 (v) 101011101111_2

3.5.5 Converting Binary Numbers to Hexadecimal Numbers

From the symbols used in the hexadecimal number system, the value represented by “F” possesses the largest numerical value. This can be indicated as a four-bit binary number; 1111_2 . Thus, all the digits in the hexadecimal number system can be indicated as four-bit binary numbers. Given below in Table 3.12 are the binary numbers for the digits used in the hexadecimal number system.

Table 3.12 – Indicating hexadecimal digits in decimal and binary numbers.

Decimal Number	Hexadecimal Number	Binary Number
0	0	0000
1	1	0001
2	2	0010
3	3	0011
4	4	0100
5	5	0101
6	6	0110
7	7	0111
8	8	1000
9	9	1001
10	A	1010
11	B	1011
12	C	1100
13	D	1101
14	E	1110
15	F	1111

As shown in the table above (Table 3.12), four bits are used to indicate a hexadecimal number in binary form. ($16 = 2^4$)

Example

Converting number 10110_2 to a hexadecimal number.

- First, divide the number into four-bit clusters from the right corner to the left corner.
- Write hexadecimal numbers separately for each cluster.
- Write these numbers in order from the left corner to the right corner and write down the base.

$$\underline{\underline{10110_2 = 16_{16}}}$$

Example

Converting number 10111011100_2 to a hexadecimal number.

$$\underline{\underline{10111011100_2 = 5DC_{16}}}$$

Activity

Convert the following binary numbers to hexadecimal numbers.

- (i) 11011010_2 (ii) 11111001101_2 (iii) 10011100011_2
 (iv) 10110111100_2 (v) 101111011110_2

3.5.6 Converting Octal numbers to Binary Numbers

We have learned above that an octal number can be indicated in three digits when it is converted to a binary number.

Thus, each digit in octal numbers should be written in three digits when it is converted to base two.

Example

Converting number 457_8 to a binary number.

- Firstly, write each digit in octal number in three bits.
- Secondly, write down all the bits together to get the binary number for the octal number.

4	5	7
100	101	111

$$\underline{\underline{457_8 = 100101111_2}}$$

Activity

Convert the following octal numbers to binary numbers.

- (i) 10_8 (ii) 245_8 (iii) 386_8 (iv) 706_8 (v) 465_8

3.5.7 Converting Hexadecimal Numbers to Binary Numbers

You have learnt earlier that any symbol in a hexadecimal number can be written in a four-bit binary number. Thus, when a hexadecimal number is converted to a binary number, each digit in that number should be indicated in a four-bit binary number.

Example

Converting number 74_{16} to a binary number.

$$\begin{array}{c|c} 7 & 4 \\ \hline 0111 & 0100 \end{array}$$

$$\underline{\underline{74_{16} = 1110100_2}}$$

Converting number $2AE_{16}$ to a binary number.

$$\begin{array}{c|c|c} 2 & A & E \\ \hline 0010 & 1010 & 1110 \end{array}$$

$$\underline{\underline{2AE_{16} = 1010101110_2}}$$

Activity

Convert the following hexadecimal numbers to binary numbers.

(i) 78_{16}

(ii) $B2C_{16}$

(iii) $4DEF_{16}$

(iv) $3DF_{16}$

(v) 1069_{16}

3.5.8 Converting Octal numbers to Hexadecimal Numbers

Example

Converting number 1057_8 to a hexadecimal number.

- First, write each digit in octal number in three bits.
- Divide the binary number you get into four-bit clusters from the right corner to the left corner.
- Write the related hexadecimal number for each cluster.

$$\begin{array}{c|c|c|c} 1 & 0 & 5 & 7 \\ \hline 001 & 000 & 101 & 111 \\ \hline \end{array}$$

$$001000101111$$

$$\begin{array}{c|c|c} 2 & 2 & 15 \\ \hline 2 & 2 & F \\ \hline \end{array}$$

$$\underline{\underline{1057_8 = 22F_{16}}}$$

Activity

Convert the following octal numbers to hexadecimal numbers

(i) 320_8

(ii) 76_8

(iii) 134_8

(iv) 452_8

3.5.9 Converting Hexadecimal Numbers to Octal Numbers

First, the hexadecimal number should be converted to a binary number and then it should be converted to an octal number.

Example

Converting number $23A_{16}$ to an octal number.

$$\begin{array}{c|c|c} 2 & 3 & A \\ \hline 0010 & 0011 & 1010 \\ \hline \end{array}$$

$$\begin{array}{c|c|c|c} 001 & 000 & 111 & 010 \\ \hline 1 & 0 & 7 & 2 \\ \hline \end{array}$$

$$\underline{\underline{23A_{16} = 1072_8}}$$

Activity

Convert the following hexadecimal numbers to octal numbers.

(i) 96_{16}

(ii) $A7B_{16}$

(iii) $10ED_{16}$

(iv) $15F_{16}$

3.6 Data Storage Capacity

A certain space is needed to store data in the computer. Data storage capacity is measured by units such as bits, bytes, kilobytes, Megabytes, Gigabytes, Terabytes and Petabytes. Let us understand how to arrange these different data storage capacities in order from the small unit to the big unit and to define the relationships between these as well.

3.6.1 Units to Measure Data Storage

Bit

This is the smallest unit used in the computer to store data. This word is coined from the words Binary Dig it A bit is represented by the two binary digits; 0 and 1.

Byte

1 byte is 8 bits.

Nibble

A nibble is half of a byte or 4 bits. This unit is not commonly used like bits and bytes.

kilobyte

This consists of 1024 bytes. ($1024 = 2^{10}$) Kilobyte is written as KB or kbyte.

Megabyte

This consists of 1024 kilobytes ($1024 = 2^{10}$) or 1048576 bytes. Megabyte is written as MB or mbyte.

Gigabyte

One Gigabyte is made of 1024 Megabytes. (1024 MB) Gigabyte is written as GB or gbyte. It is wrong to write 'Gb' as it indicates gigabit.

Terabyte

One Terabyte is made of 1024 Gigabytes (1024 GB). This is written as TB.

Petabyte

One Petabyte is made of 1024 Terabytes (1024 TB).

Observation

Following are the relationships between units which measure data storage capacity.

8 bits	= 1 byte
4 bits	= 1 nibble
1024 bytes	= 1 kilobyte (KB)
1024 kilobytes	= 1 Megabyte (MB)
1024 Megabytes	= 1 Gigabyte (GB)
1024 Gigabytes	= 1 Terabyte (TB)
1024 Terabytes	= 1 Petabyte (PB)

In production of hard discs there are instances 1024 is considered as 1000.

Consider the examples given below to get an idea about the units above.

(Table 3.13)

Table 3.13 – Approximate data storage capacity as text pages

Name	Abbreviation	Approx. Bytes	Exact Bytes	Approx. Text Pages
Byte	B	One	1	One text
Kilobyte	KB (or K)	Thousand	1,024	$\frac{1}{2}$ page
Megabyte	MB	One million	1,048,576	500 pages
Gigabyte	GB	One billion	1,073,741,824	500,000 pages
Terabyte	TB	One trillion	1,099,511,627,776	500,000,000 pages

3.6.2 Capacities of Data Storage Devices

Different storage devices possess different storage capacities. The tasks fulfilled by these devices are also different. Let us study these different storage devices. (Figure 3.8)

Figure 3.8 – Capacities of storage devices

When reading and writing data, the time spent to access the devices (access speed) is different. Consider the figure given below. (Figure 3.13)

3.6.3 Data Access Speed

Figure 3.9 – Data access speed

3.6.4 Cost per unit Storage

For different storage devices, cost per a bit to store data is different. For instance, the cost is more for Register Memory and Cache Memory. The comparison is shown in the figure given below. (Figure 3.10)

Figure 3.10 – Cost per unit storage

3.7 Coding Systems

Figure 3.11 – Data you enter to the computer and computer data representation

According to the above figure (Figure 3.15), when you enter a data to the computer, it converts the data to different patterns made of 0 and 1. Thus, binary codes are used when storing numeric, alphabetic, special character, images and sounds in internal storage devices of computers.

In the beginning of the lesson, when you type ‘A’ on the keyboard, the code you get for ‘A’ is the bits pattern 1000001 (the binary code of letter ‘A’). The number of bits used is 7. Thus, a combination made of a bit pattern is used to represent each data and the bits used for each code is different. Following are different coding systems used.

1. BCD Binary Coded Decimal
2. ASCII American Standards Code for Information Interchange
3. Unicode

3.7.1 BCD - Binary Coded Decimal

This coding system is used to represent decimal numbers. Each decimal number is represented using 4 bits. Since each digit is converted separately into a 4-bit binary value, rather than converting the entire number at once, it becomes easier to read and display decimal digits. Errors in rounding decimal numbers do not occur.

Therefore, it is commonly used in digital clocks, calculators, and monetary calculation systems.

Table 3.14 – Decimal Numbers and BCD Values

Decimal Value	BCD Value
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001

Example

Indicating number 37_{10} in BCD codes.

$$\begin{array}{cc}
 3 & 7_{10} \\
 0011 & 0111 \\
 37_{10} = & 00110111
 \end{array}$$

Activity

Write the BCD values for the numbers given below.

- (i) 302 (ii) 2136 (iii) 7295 (iv) 4506
 (v) 11101_2 (vi) $2B_{16}$ (vii) 43_8

3.7.2 ASCII – American Standard Code for Information Interchange

Initially ASCII coding system used 7-bit binary digit. 128 characters can be represented using this coding system. ASCII is used to represent text. (Appendix - Table 3.17)

ASCII system is designed and approved by ANSI (American National Standard Institute).

Example

- Text

When the word ‘School’ is entered into the computer through the keyboard, write down how it is understood by the computer. (Use Appendix Table 3.7)

- ⌚ First, write the decimal numbers for the symbols.

S - 83 c - 99 h - 104 o - 111 l - 108

- ⌚ Write binary numbers for each value.

S - 1010011 c - 1100011 h - 1101000 o - 1101111
l - 1101100

- ⌚ Write the associated code

S c h o o l
101001111000111101000110111111011111101100

Activity

Write down the ASCII code of “ICT” in binary numbers.

(i) ICT

(ii) POT

(iii) Computer

3.7.3 Unicode System

10 characters can be used in the BCD system and 128 characters can be used in the ASCII system for data representation. But these systems cannot be used for Sinhala, Japanese, Chinese and Tamil languages as there are more than 128 characters. Hence Unicode system was designed according to a standard to represent 65536 different symbols of 16 bits ($2^{16} = 65536$).

At present, Unicode version 17.0.0 has added 4,803 new characters, increasing the total number of representable characters to 159,801.

Figure 3.12 – Occasions Unicode are used

Unicode system uses unique number for each number, text or symbol in any or Operating System.

Example

- **Picture and Graphic Data**

Given below (Figure 3.17) is a close up or a highly enlarged image of photograph. A photograph consists of pixels (dots) made of different colours in big grid. Computer graphic data such as pictures, frames of a movie or frames of an animation consist of various colours. The picture given below consists of a number of different colours.

Figure 3.13 – Colours in a picture and their binary values.

- **Sound**

As shown in the figure below (Figure 3.17) is the sound emitted from a speaker is normally represented as analog waves. However, all data in computer are digital data and those are made of bytes. Hence, sound which comes as a analog data is converted to a digital data. Thus, a sound is also represented in a bits pattern made of 0s and 1s in a computer.

Figure 3.14 – Conversion of analog data of a sound to digital data

By this coding system, codes are classified to represent characters of all the international languages. The institution which initiated is the International Standard Institution and Unicode Consortium. Unicode is largely used in designing websites and newspapers. (Appendix - Table 3.15)

Activity

1. If 'A' character is represented as 1000001 in ASCII system, what is the ASCII code for letter 'F'?
2. What is the largest number presented in BCD (Binary Coded Decimal)?
3. Convert the octal number 458 to BCD number.
4. What are the coding systems used in computers? Explain the need to use such coding systems.
5. Write examples for the use of BCD, ASCII, and Unicode coding systems. need to use such coding systems.

Appendix

ASCII and EBCDIC codes for characters and related decimal, octal and hexadecimal numbers

Table 3.15 - ASCII and EBCDIC codes for characters and related decimal, octal and hexadecimal numbers

Decimal	Hex	Octal	ASCII Character	Decimal	Hex	Octal	EBCDIC Character	ASCII Character
00	00	000	NUL	128	80	200		
001	01	001	SOH	129	81	201	a
